

Handling and transportation of meters

Water meters are precision instruments and must be handled with care. Please follow these guidelines to ensure the meter functions correctly:

- Handle and transport meters with care to prevent damage.
- Ensure meters are properly restrained during transportation and stored appropriately.
- Keep meter caps on until installation as this prevents the measuring chamber from drying out.
- Flush the service line prior to meter installation to remove debris.
- Ensure correct orientation by noting the direction of flow during installation.
- After installation, energise the system gradually while bleeding air from the line to prevent damage to meter components.

It is essential to properly handle and care for the meter from collection through to installation, creating a more accurate and reliable meter.
